Re: Traffic Impact Study
Lowell Road and Central Street Commercial Development
Hudson, New Hampshire

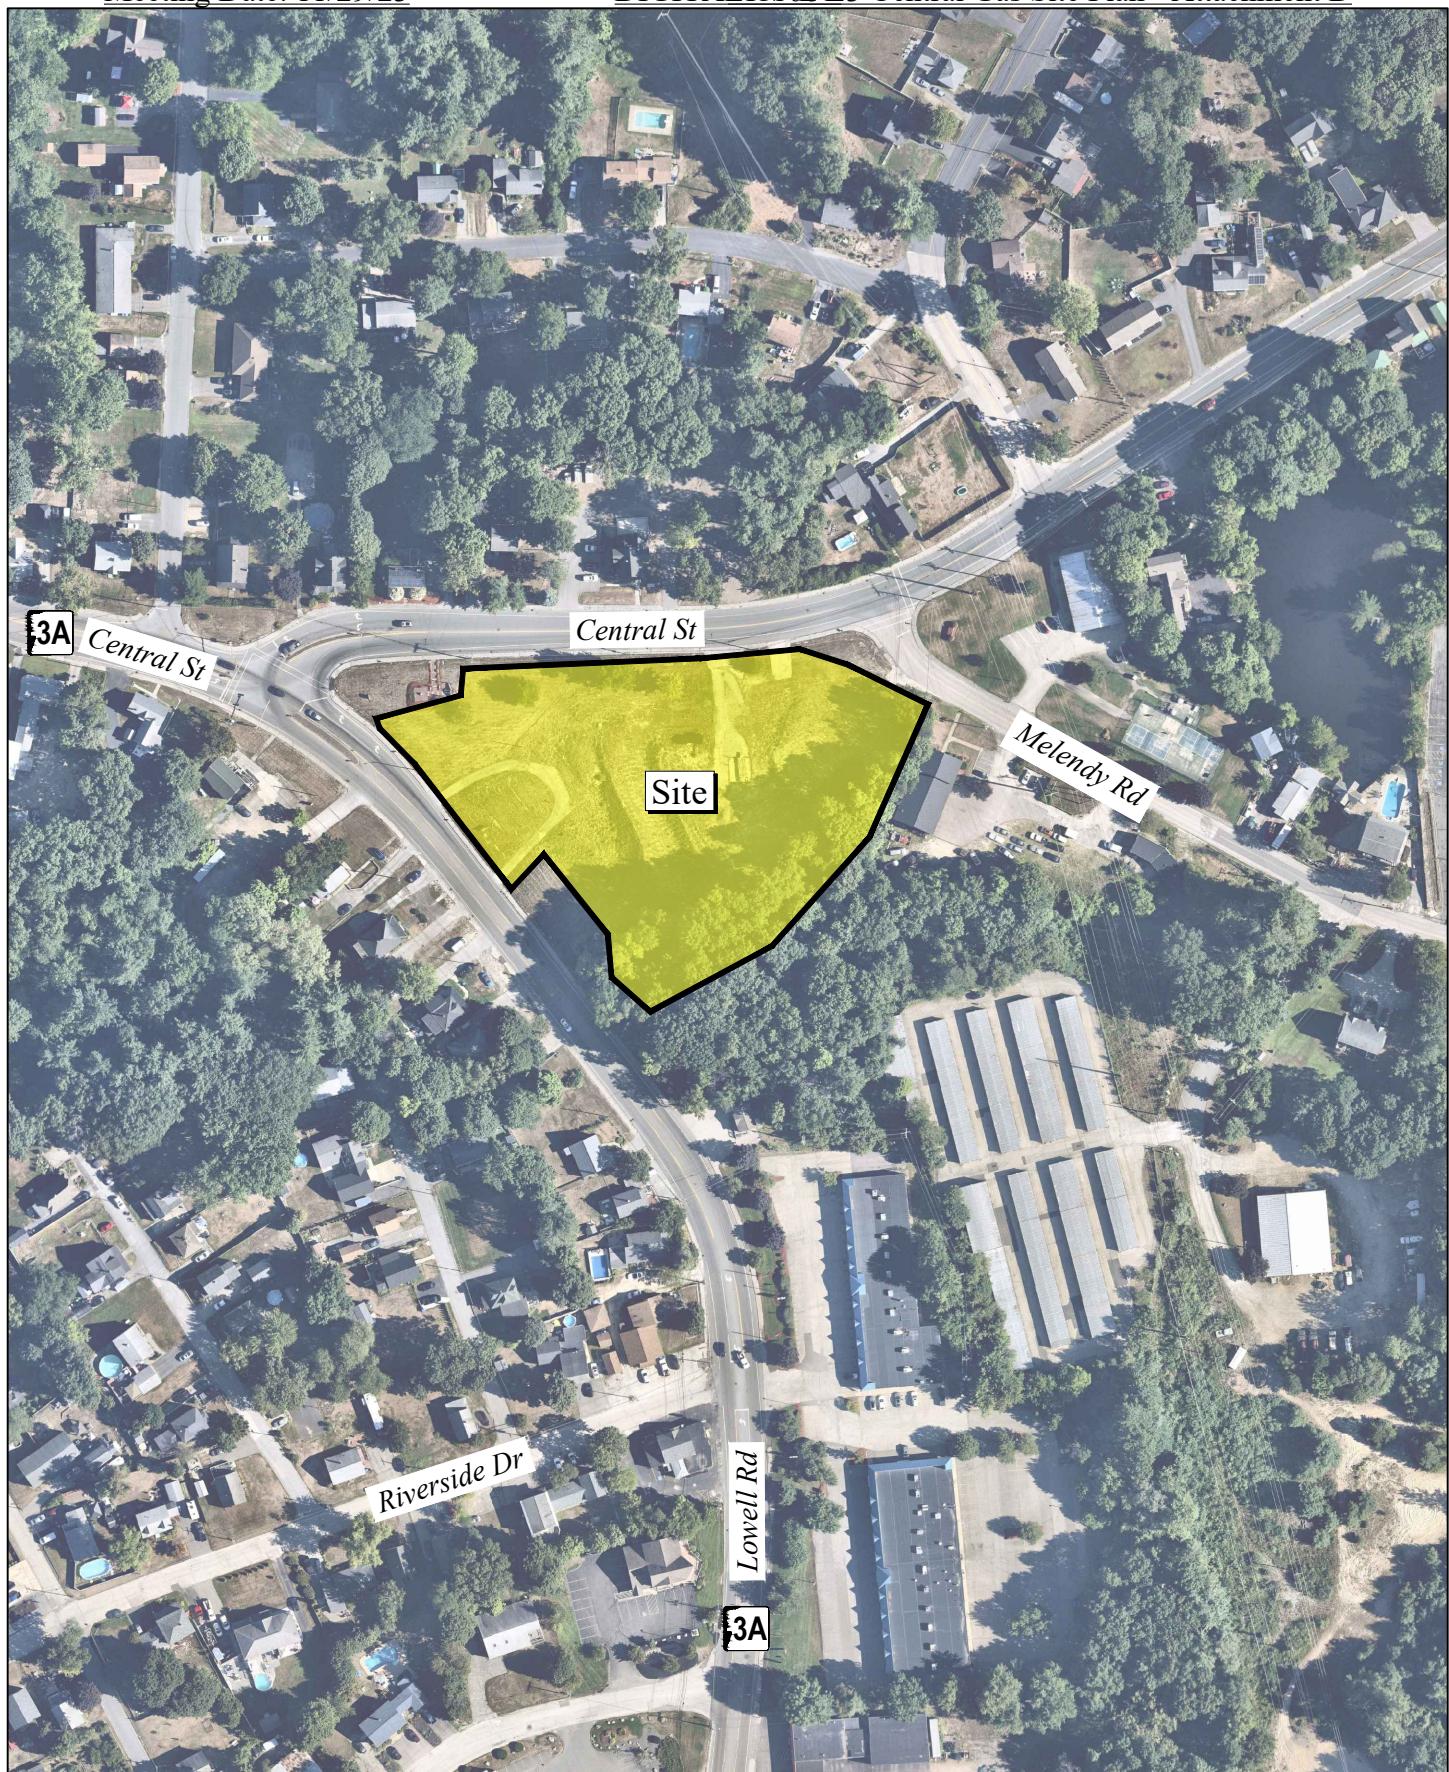

Vanasse Hangen Brustlin, Inc. (VHB) has prepared this Traffic Impact Study to summarize the anticipated transportation impacts associated with the proposed commercial development to be located on the southeast corner of the Lowell Road and Central Street signalized intersection in Hudson, New Hampshire. As proposed, a 10 vehicle fueling position gasoline station and a 4,560 square foot convenience store with a drive-through coffee shop will be constructed. Access is proposed to be provided via a right-turn in only driveway on the east side of Lowell Road and a full access driveway on the south side of Central Street. The site location in relation to the surrounding roadway network is shown on Figure 1.

In the vicinity of the site, Lowell Road and Central Street are under Town of Hudson jurisdiction. Therefore, review and approval are expected to be required with respect to traffic through the Town of Hudson permitting process. Based on coordination efforts with the Hudson Town Engineer and Town Planner, the impacts of the proposed development were evaluated at the Lowell Road and Central Street.

Existing Conditions

Existing conditions were developed by conducting field reconnaissance and obtaining traffic counts at the Lowell Road and Central Street study area signalized intersection. At the signalized intersection, Lowell Road is the south leg and Central Street is the north and east legs. NH Route 3A represents the major travel route and is aligned in a general north-south direction along Lowell Road south of the intersection and Central Street north of the intersection. The Lowell Road south leg and the Central Street north leg are functionally classified as Principal Arterials and legislatively categorized as Class IV: Compact Roads. The Central Street east leg is functionally classified as a Minor Arterial and legislatively categorized as a Class IV: Compact Road. The speed limit along the three approaches is posted at 30 miles per hour (mph). There is a Hudson Firefighters Memorial at Hammond Park located on the southeast corner of the intersection.

The Lowell Road northbound approach consists of a through lane and an exclusive right-turn lane. The Central Street southbound approach includes an exclusive left-turn lane and a through lane. The Central Street westbound approach contains an exclusive left-turn lane and an exclusive right-turn lane. Directional flows along the three legs are separated by raised median islands. There are sidewalks provided along both sides of each leg of the intersection with crosswalks striped across the Central Street north leg and the Central Street east leg. The traffic signal operates on a four phase system with a Central Street southbound approach left-turn lead phase, a Lowell Road northbound through/right-turn and a Central Street southbound through permissive phase, a Central Street westbound phase with a Lowell Road northbound right-turn overlap, and an exclusive pedestrian phase.

Site Location Map

Page 3

Memorandum

On the Lowell Road approach, there is a Right Lane for Right Turn sign and a lane designation sign. On the Central Street southbound approach, there is a No Turn on Red Arrow sign for the left-turn lane, a No Turn on Red sign posted for the through lane, and a lane designation sign. On the Central Street westbound approach, there is a No Turn on Red Arrow sign for the left-turn lane, a Right Turn on Red After Stop sign for the right-turn lane, and a lane designation sign. There are No Parking signs posted along Lowell Road and Central Street.

Traffic Volumes

Traffic Counts

Base traffic conditions at the study area intersection were developed by obtaining turning movement counts (TMCs) and vehicle classification counts between Wednesday, September 7, 2022, and Saturday, September 10, 2022 at the study area intersection. The traffic counts were provided by the Hudson Town Engineer using the GRIDSMART system installed at the signalized intersection for 24 hour periods to capture weekday AM, weekday PM, and Saturday midday peak hour traffic volumes. The traffic count data are provided in the Appendix.

Seasonal Adjustment

Traffic on a given roadway typically fluctuates throughout the year depending on the area and the type of roadway. Based on New Hampshire Department of Transportation (NHDOT) guidelines for the preparation of a traffic study, existing traffic volumes must represent peak-month conditions. Upon review of seasonal adjustment and historical count data provided by NHDOT, traffic volumes in the month of September are approximately 5 percent lower than peak-month volumes.¹ Therefore, the September 2022 traffic counts were increased by 5 percent to represent 2022 peak-hour traffic volumes during peak-month conditions. The NHDOT seasonal adjustment data are provided in the Appendix.

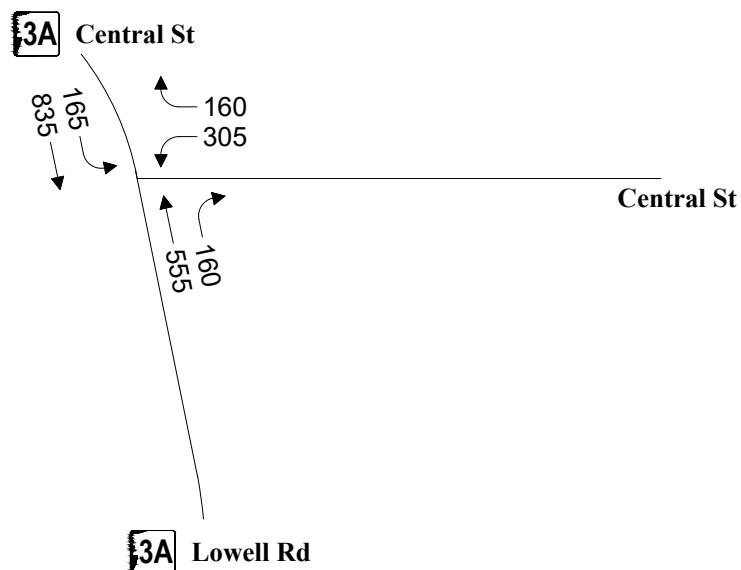

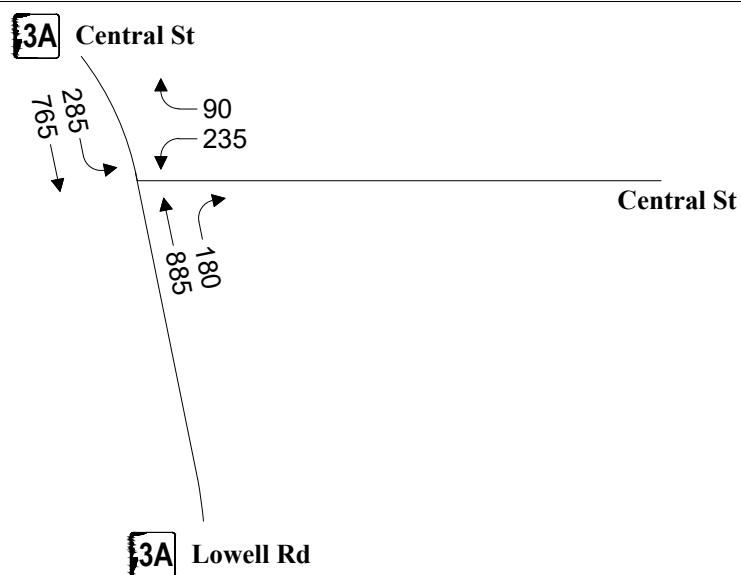

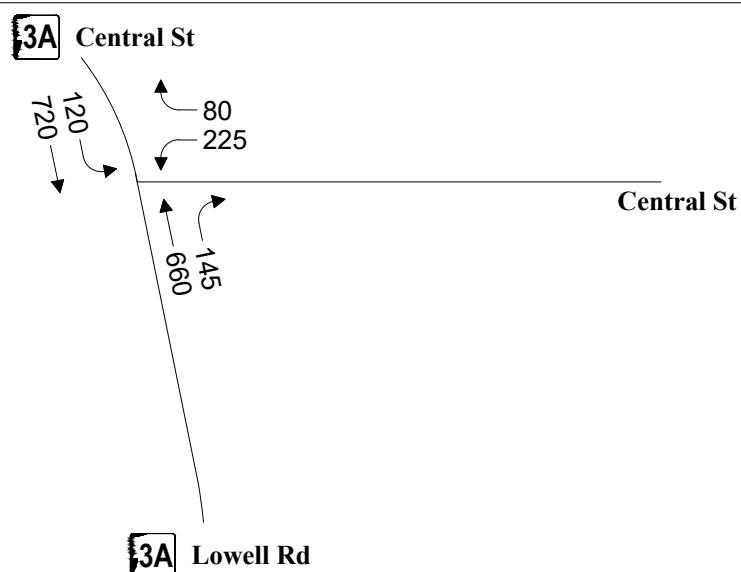

Pandemic Adjustment

Due to the coronavirus disease 2019 (COVID-19) pandemic, traffic volumes may not represent normal travel conditions along New Hampshire roadways. To determine whether a pandemic adjustment should be made to the 2022 peak-month traffic volumes, NHDOT guidance is to review historical traffic counts from nearby permanent count stations during the month of full data that is nearest to the month of the counts and the same month prior to the pandemic.² Based on this NHDOT methodology, a comparison of the September 2019 and September 2022 data shows that traffic volumes have decreased during the weekday AM, weekday PM, and Saturday midday peak hours. Therefore, the 2022 peak-month traffic volumes were increased to account for the pandemic.³ The pandemic adjustment calculations are provided in the Appendix. Figure 2 graphically depicts the 2022 Existing weekday AM, weekday PM, and Saturday midday peak hour traffic volumes.

² NHDOT Transportation Data Management System, Location ID: 02297001 along US Route 3 (Daniel Webster Highway) north of Hilton Drive in Merrimack.

³ Traffic volumes were increased by 1.198 during the weekday AM peak hour, 1.082 during the weekday PM peak hour, and 1.025 during the Saturday midday peak hour.

Capacity and Queue Analyses

Capacity Analysis Methodology

Capacity analyses were performed for the Lowell Road and Central Street intersection with the 2022 Existing traffic volumes during the weekday AM, weekday PM, and Saturday midday peak hours based on the concepts and procedures in the Highway Capacity Manual (HCM) using the *Trafficware Synchro Software* computer program. This software program is a NHDOT approved traffic analysis tools for determining intersection capacity operations. Based on NHDOT guidelines,⁴ HCM 2000 methodologies⁵ are preferred for signalized intersections. In addition, HCM 6th edition⁶ is the NHDOT accepted methodology for unsignalized intersections. Therefore, the HCM 2000 methodologies and procedures have been used to evaluate operations at Lowell Road and Central Street signalized intersection and the HCM 6th edition was used for the unsignalized study area intersections.

The analysis results are categorized in terms of Level of Service (LOS), which describes the qualitative intersection operational conditions based on the calculated average delay per vehicle. The criteria for unsignalized intersections are different than for signalized intersections because drivers expect different performance levels from each type of intersection. The relationship between LOS and delay is summarized in Table 1.

Table 1 Level of Service Criteria

| Level of Service | Unsignalized Intersection Criteria | Signalized Intersection Criteria |
|------------------|--|--|
| | Average Total Delay (Seconds per Vehicle) | Average Total Delay (Seconds per Vehicle) |
| A | < 10.0 | < 10.0 |
| B | 10.1 to 15.0 | 10.1 to 20.0 |
| C | 15.1 to 25.0 | 20.1 to 35.0 |
| D | 25.1 to 35.0 | 35.1 to 55.0 |
| E | 35.1 to 50.0 | 55.1 to 80.0 |
| F | > 50.0 | > 80.0 |

Source: Highway Capacity Manual 2000.

Queue Length Methodology

The study area intersections were also evaluated with respect to vehicle queuing. For signalized intersections, the quantitative measures of vehicle queue length are defined as the 50th and the 95th percentile queues. The 50th percentile queue represents the average queue length during the peak hour and the 95th percentile queue represents the calculated maximum back of queue that has a probability of 5 percent or less of being exceeded during the peak hour.

⁴ New Hampshire Department of Transportation Bureau of Traffic. Synchro Inputs Checklist. 16 Aug. 2021.

⁵ Transportation Research Board. Highway Capacity Manual. 2000.

⁶ Transportation Research Board. Highway Capacity Manual. 6th edition.

Manny Sousa
Ref: 52945.00
June 30, 2023
Page 6

Memorandum

For unsignalized intersections, the quantitative measure of vehicle queue length is defined as the 95th percentile queue. The 95th percentile queue represents the percent of time during the peak period being analyzed that the calculated maximum back of queue would be equal to or less than the percentile estimate (i.e., the maximum queue length that would be exceeded only 5 percent of the time).

Intersection Operational Results

The capacity and queue length analysis results are summarized in Table 2 for the 2022 Existing traffic-volume conditions. The computer-generated analysis reports are provided in the Appendix. As shown, there are long delays (LOS E/F) on the Central Street westbound left-turn lane during the weekday commuter peak hours, as well as long delays (LOS E) on the Central Street southbound left-turn lane and the Lowell Road northbound through lane during the weekday PM peak hour. In addition, the signalized intersection currently operates with capacity constraints (volume-to-capacity [v/c] ratio > 1.00) within the Central Street westbound left-turn lane during the weekday AM peak hour and within the Lowell Road northbound through lane during the weekday PM peak hour.

Memorandum

Future Conditions

The impact of site-generated traffic within the study area has been evaluated under two design horizons: 2023 and 2033 traffic-volume conditions. Traffic volumes on the roadway network would include existing traffic, new traffic due to normal traffic growth, and traffic related to significant development by others that are expected to be completed within the design horizons. The one-year design horizon (2023) represents conditions that can determine the impacts of the proposed development, whereas the 11-year design horizon (2033) is typically used for planning purposes.

Consideration of these factors resulted in the development of 2023 and 2033 No-Build traffic volumes, which assume the proposed project is not built. The incremental impacts of the proposed development may then be determined by adding site-generated traffic volumes (Build conditions) and making comparisons to the baseline conditions.

No-Build Conditions

Traffic growth is a function of the expected land development in a region. To predict a rate at which traffic can be expected to grow during the forecast periods, both historical growth and planned areas developments were examined.

Historical Growth

An annual average traffic-growth percentage was determined based on NHDOT historical traffic-volume data. Based on a review of NHDOT count stations within Southeast Growth Region (in which the Town of Hudson resides) between 1999 and 2019, traffic volumes have experienced an annual increase of 0.67 percent. Consistent with NHDOT preference, a minimum of a 1.0 percent compounded annual growth rate was used to account for general population growth and traffic generated by smaller area developments. The NHDOT historical traffic volume data are provided in the Appendix.

Background Developments

Traffic to be generated by planned developments anticipated to add substantial traffic volumes through the study area were considered in projecting future traffic volumes. Based on discussions with the Hudson Town Planner, the following developments were included within the future traffic-volumes as part of this traffic study.

› Hudson Logistics Center

- This development is located at 43 Steele Road and is proposed to consist of a 1.4 million square foot single fulfillment center warehouse.
- The traffic volumes associated with the Hudson Logistics Center development were obtained from the traffic study prepared for that project⁷ and based on Institute of Transportation Engineers (ITE) methodologies⁸ to develop the Saturday midday peak hour trips. The trips for this background development are provided in the Appendix.

⁷ Langan Engineering & Environmental Services, Inc. Traffic Impact Study: Hudson Logistics Center, 43 Lowell Road, Hudson, NH. September 2022.

Manny Sousa
Ref: 52945.00
June 30, 2023
Page 9

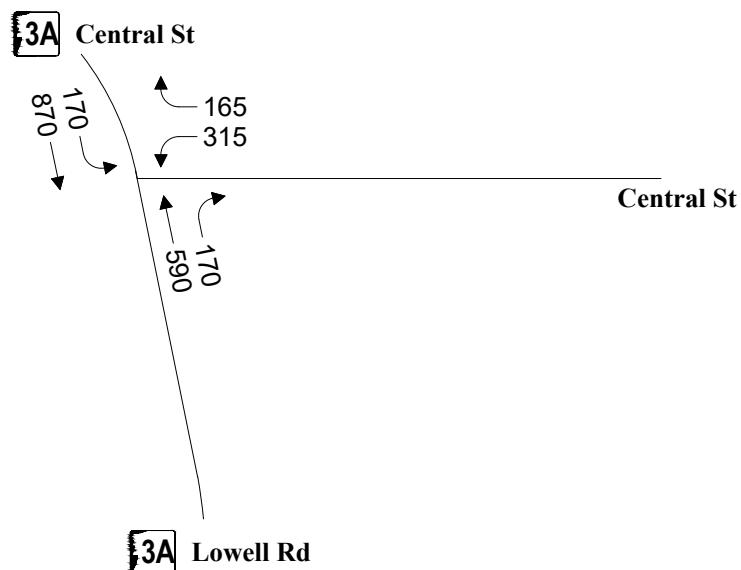

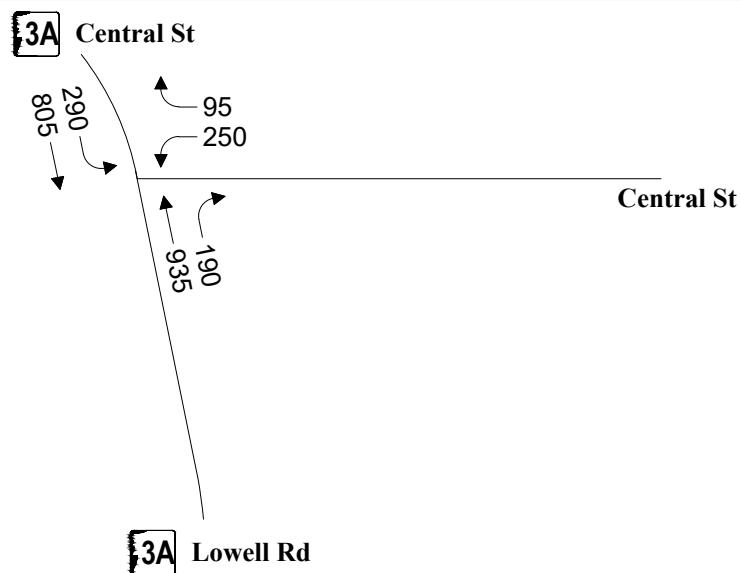

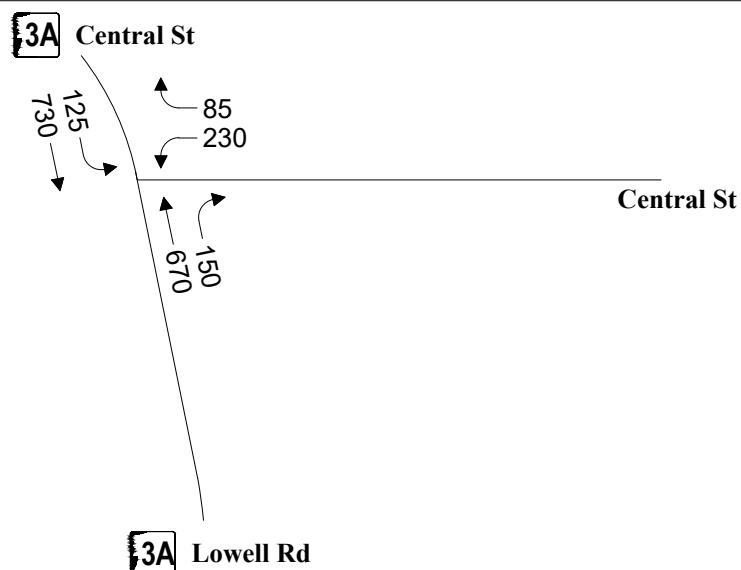

Memorandum

- › Frenette Gardens Subdivision
 - This development is located at 65 Central Street and consists of 9 single-family homes.
 - The traffic volumes associated with the Frenette Gardens subdivision were estimated based on ITE methodologies. The trips for this background development are provided in the Appendix.
- › Bluebird Self-Storage Facility
 - This development is located at 196-202 Central Street and consists of a 118,200 square foot self-storage facility.
 - The traffic volumes associated with the Bluebird self-storage facility were estimated based on ITE methodologies. The trips for this background development are provided in the Appendix.
- › Potential Cumberland Farms Renovation
 - The existing Cumberland Farms gasoline station and convenience store located at 189 Central Street may be renovated.
 - Since a specific program had not been submitted at the time of coordination efforts with local officials for this traffic study, additional trips associated with that project were not included within the future traffic volume projections for this Traffic Impact Study.

No-Build Traffic Volumes

The 2023 No-Build peak hour traffic volumes were accordingly developed by applying a 1 percent compounded annual traffic growth rate to the 2023 Existing volumes and adding traffic associated with Hudson Logistics Center, Frenette Gardens subdivision, and Bluebird self-storage facility. The 2023 No-Build traffic volumes are shown graphically on Figure 3 for the weekday AM, weekday PM, and Saturday midday peak hours.

The 2033 No-Build peak-hour traffic volumes were accordingly developed by applying a 1 percent compounded annual traffic growth rate (or 11.6 percent over 11 years) to the 2022 Existing volumes and adding traffic associated with Hudson Logistics Center, Frenette Gardens subdivision, and Bluebird self-storage facility. The 2033 No-Build traffic volumes are shown graphically on Figure 4 for the weekday AM, weekday PM, and Saturday midday peak hours.

Memorandum

Build Conditions

For purposes of this traffic study, the proposed development program evaluated consisted of constructing a 10 vehicle fueling position gasoline station and a 4,560 square foot building to include 3,760 square foot convenience store and an 800 square foot coffee shop with a drive-through window. Access is proposed to be provided via a right-turn in only driveway on the east side of Lowell Road and a full access driveway on the south side of Central Street.

Sight Distance

Sight distances have been evaluated at the site driveway locations to determine if the available sightlines for vehicles exiting the site meet or exceed the minimum distances required for approaching vehicles to safely stop. In accordance with the Town of Hudson Land Use Regulations (Chapter 193: Driveways), stopping sight distances are required to be provided that meet or exceed the minimum sightline requirements as established by the American Association of State Highway and Transportation Officials (AASHTO).⁹ Therefore, the available sightlines were compared with AASHTO as the national standard by which vehicle sight distance is calculated, measured, and reported.

Sight distance is the length of roadway ahead visible to the driver. The Stopping Sight Distance (SSD) is the minimum distance required for a vehicle traveling at a certain speed to safely stop before reaching a stationary object in its path. The Intersection Sight Distance (ISD) is provided on minor street approaches to allow the drivers of stopped vehicles a sufficient view of the major roadway to decide when to enter the major roadway. Based on the posted speed limit of 30 mph, the SSD and ISD requirements at the proposed site driveways were calculated using the AASHTO methodology. The required minimum sight distances are shown in Table 3.

Table 3 Sight Distance Summary

| Location/Condition | Stopping Sight Distance (feet) | | Intersection Sight Distance (feet) | |
|-------------------------------------|--------------------------------|--------------------|------------------------------------|--------------------|
| | To/From North/East | To/From South/West | To/From North/East | To/From South/West |
| Lowell Road Site Driveway | | | | |
| Measured | 400+ | 400+ | 400+ | 400+ |
| Minimum Required ^a | 200 | 200 | 200 | 200 |
| Desirable ^b | 205 | 205 | 335 | 335 |
| Central Street Site Driveway | | | | |

a Minimum Required SSD lengths based on AASHTO Table 9-7 Design Intersection Sight Distance – Case B1, Left Turn from Stop for posted speed limits of 30 mph. Minimum Required ISD lengths based on Minimum Required SSD values.

b Desirable SSD lengths based on AASHTO Equation 3-2 with posted speed limits of 30 mph. Desirable ISD lengths based on AASHTO Equation 9-1 for the posted speed limits of 30 mph.

⁹ *A Policy on Geometric Design of Highways and Streets*, 6th Edition. Washington, D.C.: American Association of State Highway and Transportation Officials (AASHTO), 2011.

Manny Sousa
Ref: 52945.00
June 30, 2023
Page 13

Memorandum

As indicated in Table 3, available sight distances to the north and south of the proposed Lowell Road site driveway and to the east and west of the proposed Central Street site driveway exceed the AASHTO SSD and ISD requirements. To encourage safe and efficient flow of traffic to and from the site, proposed plantings, vegetation, landscaping, and signing along the site frontage and at the site driveway are recommended to be kept low to the ground or set back sufficiently from the edge of the roadways so as not to inhibit the available sight lines in the future.

Trip Generation

To estimate the volume of traffic to be generated by the proposed development, trip rates published in the ITE Trip Generation Manual were researched for Land Use Code (LUC) 945 (Convenience Store/Gas Station) and LUC 937 (Coffee/Donut Shop with Drive-Through Window). The trip-generation summary is provided in Table 4 with the trip-generation calculations provided in the Appendix.

Table 4 Trip-Generation Summary

| Time Period/Direction | Gas Station/ Convenience Store ^a | Coffee Shop ^b | Total Trips |
|----------------------------------|--|--------------------------|-------------|
| Weekday Daily | | | |
| Enter | 1,317 | 214 | 1,530 |
| Exit | 1,317 | 214 | 1,530 |
| Total | 2,634 | 428 | 3,060 |
| Weekday AM Peak Hour | | | |
| Enter | 107 | 35 | 142 |
| Exit | 107 | 34 | 141 |
| Total | 214 | 69 | 283 |
| Weekday PM Peak Hour | | | |
| Enter | 103 | 16 | 119 |
| Exit | 103 | 16 | 119 |
| Total | 206 | 32 | 238 |
| Saturday Midday Peak Hour | | | |
| Enter | 121 | 35 | 156 |
| Exit | 121 | 35 | 156 |
| Total | 242 | 70 | 312 |

a ITE Land Use Code 945 (Convenience Store/Gas Station for subcategory 9-15 vehicle fueling positions) for 3,760 sf.

b ITE Land Use Code 937 (Coffee/Donut Shop with Drive-Through Window) for 800 sf.

The vehicle trips calculated for the proposed development shown in Table 4 represent single-use trips that the site would generate as stand-alone uses. Based on the ITE Trip Generation Handbook,¹⁰ studies have shown that some patrons of mixed-use or multi-use developments could visit more than one of the uses on the site (internal trips). In

¹⁰ Institute of Transportation Engineers. Trip Generation Handbook, 3rd ed. Washington, DC, Sept. 2017.

Manny Sousa
Ref: 52945.00
June 30, 2023
Page 14

Memorandum

addition, not all of the vehicle trips expected to be generated by the proposed development represent new trips on the study area roadway system. Accordingly, ITE Trip Generation Handbook methodologies provide data to support a portion of the vehicles visiting a proposed gas station and coffee shop may already be present in the adjacent passing traffic stream (pass-by trips). Table 5 summarizes the trip-generation characteristics of the proposed development and the calculations are provided in the Appendix.

As shown in Table 5, the proposed development is estimated to generate 53 new trips (27 entering and 26 exiting) during the weekday AM peak hour, 50 new trips (46 entering and 46 exiting) during the weekday PM peak hour, and 64 new trips (32 entering and 32 exiting) during the Saturday midday peak hour.

Table 5 Trip-Generation Characteristics Summary

^c Total Trips minus Internal Trips.

^d Based on ITE Trip Generation Handbook.

^e External Trips minus Pass-By Trips.

Build Traffic Volumes

The directional distribution of new site trips is dependent on the combination of a number of factors, including existing travel patterns, competing opportunities, and site access routes. The directional distribution of pass-by traffic was determined based on the existing travel patterns observed along Lowell Road and Central Street adjacent to the site as part of the traffic counts collected in September 2022. Based on the traffic-generation and distribution estimates for the proposed commercial development, the site trips were assigned to the adjacent roadway network. The project-generated traffic volumes are shown on Figures 5 through 7 for the weekday AM, weekday PM, and Saturday midday peak hours.

As presented in Figures 5 through 7 based on the trip-generation and distribution methodologies used within this traffic study, the proposed development is projected to increase peak hour traffic volumes in the range of 22 to 26 vehicles per hour along Central Avenue north of Lowell Road, 16 to 26 vehicles per hour along Lowell Road south of the proposed site driveway, and 6 to 12 vehicles per hour along Central Street east of the proposed site driveway. These minimal increases represent 1 additional vehicle every 2.3 to 10 minutes during the peak hours.

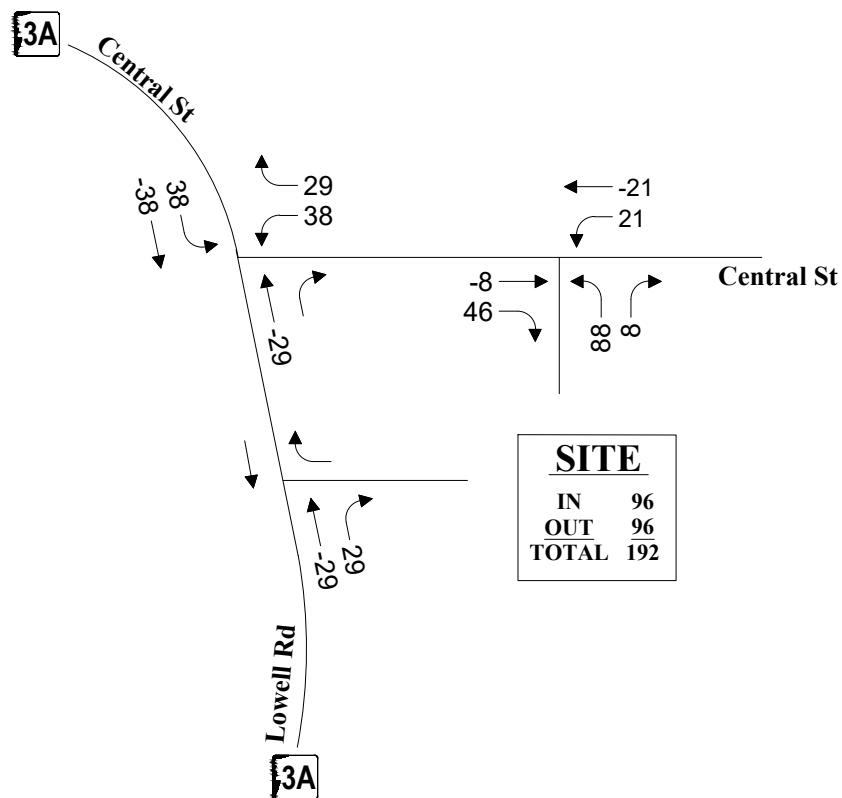

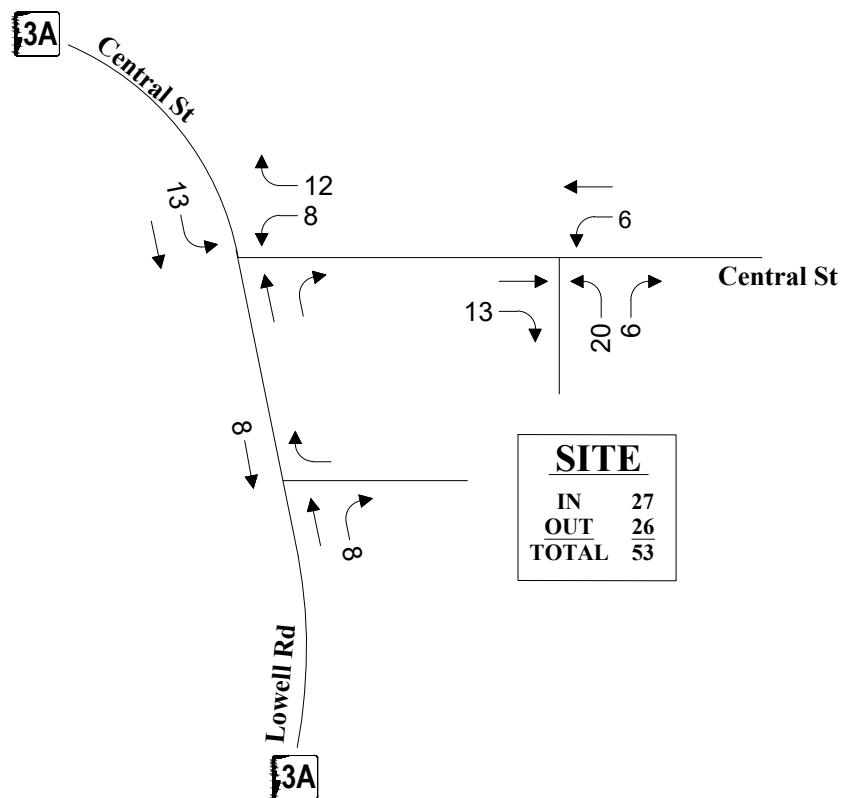

In accordance with ITE methodologies¹¹ and NHDOT guidance,¹² a development may result in a change in vehicular operations (i.e., noticeably drop level of service or increase volume to capacity ratios [v/c] ratios) if the addition of site trips would increase peak hour traffic volumes at an intersection by 100 vehicles or more. In general, traffic increases less than this threshold could be attributed to the fluctuation of vehicles due to driver patterns that occur during the day, on different days of a week, or different months of a year. As shown on Figures 5 through 7, the proposed development is not anticipated to exceed these thresholds and standard traffic engineering practice suggests that the proposed development would be expected to result in negligible impacts to the adjacent roadway system.¹³

The project-generated traffic volumes were combined with the No-Build traffic volumes to develop the Build peak-hour traffic-volume networks. The 2023 Build weekday AM, weekday PM, and Saturday midday peak-hour traffic volumes are depicted on Figure 8. The 2033 Build weekday AM, weekday PM, and Saturday midday peak-hour traffic volumes are illustrated on Figure 9.

Memorandum

Capacity and Queue Analyses

Analyses were performed for the study area intersections to examine operations under future traffic-volume conditions without the development (2023 and 2033 No-Build) and with the development (2023 and 2033 Build). The comparison of the No-Build and Build intersection operations help to demonstrate a project's impacts on the adjacent roadway network. A summary of the 2023 traffic-volume operations is reflected in Table 6 and the 2033 analyses are summarized in Table 7. The capacity analysis worksheets are provided in the Appendix.

The peak hour factor (PHF) is a measure of traffic demand fluctuations within the peak hour and the concentration of traffic volumes is not anticipated to remain stagnant with the increase in future traffic volumes. In conformance with NHDOT Bureau of Traffic's guidelines for intersection analyses, existing PHFs were increased to 0.90 for the 2033 No-Build and Build traffic volume conditions.¹⁴ For those approaches where existing PHFs were observed to be above 0.90, the PHFs were used as observed without a reduction.

Memorandum

Lowell Road and Central Street

As previously documented, the Lowell Road and Central Street signalized intersection operates with constraints on the Central Street westbound left-turn lane during the weekday AM peak hour and the Lowell Road northbound through lane during the weekday PM peak hour. By increasing traffic volumes minimally within the lane groups that are overcapacity, delays increase exponentially based on HCM calculations. As shown with the addition of future traffic growth independent of the proposed development, the delays increase by 25.7 seconds within the Central Street westbound left-turn lane between 2022 Existing and 2032 No-Build weekday AM peak hour traffic conditions and by 20.9 seconds within the Lowell Road northbound through lane between 2022 Existing and 2032 No-Build weekday PM peak hour traffic conditions.

A comparison of the proposed development's traffic impacts can be shown under the No-Build and Build Saturday midday peak hour conditions as this condition is shown to have capacity available under existing and future traffic volumes. Under 2023 No-Build and Build conditions, the proposed development is shown to increase overall intersection operations by 2.7 seconds with the Saturday midday peak hour traffic volumes and capacity is shown to be available with the v/c ratios below 1.00. Similarly, the addition of site trips to the 2033 No-Build traffic volumes (i.e., 2033 Build) results in a minor increase of 3 seconds during the Saturday midday peak hour conditions.

Central Street and Proposed Site Driveway

During the 2023 and 2033 Build traffic volume conditions, the critical movements at the Central Street and site driveway unsignalized intersection are projected to operate at LOS D or better for the weekday AM, weekday PM, and Saturday midday peak hours. Vehicle queues are projected to be less than 4 vehicles on the site driveway approach.

Improvements

The final component of a traffic study is the identification of improvement measures that are expected to be effective in eliminating or improving anticipated deficiencies resulting from the combination of existing, background, and project-generated traffic. Existing operational deficiencies have been documented at the Lowell Road and Central Street signalized intersection during the weekday commuting peak hours. In an effort to help improve operations, there is an opportunity for Town of Hudson officials and the applicant to work together in widening Lowell Road south of Central Street. Since the applicant owns a portion of the property in this area (along the east side of Lowell Road south of Central Street and along Central Street east of Lowell Road), the following measures have been investigated and are proposed as part of the proposed development project. These measures will be coordinated with Town staff.

- › The Lowell Road site driveway will be located near the southern portion of the property.
- › The Lowell Road northbound approach at Central Street consists of a through lane and an exclusive right-turn lane.
 - Between Central Street and the proposed site driveway, Lowell Road will be widened to extend the northbound right-turn lane southerly to the location of the proposed site driveway set at the southern end of the property.
 - From the proposed site driveway to the south, Lowell Road will be widened to provide a northbound right-turn lane for vehicles to enter the site.

Manny Sousa

Ref: 52945.00

June 30, 2023

Page 28

Memorandum

- › The Central Street westbound approach consists of an exclusive left-turn lane and an exclusive right-turn lane.
 - The full access driveway on Central Street will be placed to the eastern end of the property appropriately separated from the existing Meleny Road intersection.
 - The Central Street westbound two-lane approach will be lengthened.
 - This improvement extends the turn lane to the proposed site driveway.
 - The additional two-lane storage allows more access to the Central Street westbound right-turn lane (onto Central Street northbound) where the 2033 Build average queues on the left-turn lane are not projected to block the extended right-turn lane.
- › The traffic signal timings will be optimized to adjust to these improvements and the future traffic volume conditions.

In accordance with National Cooperative Highway Research Program (NCHRP) Report 457 guidelines,¹⁵ an evaluation was conducted to determine if the Lowell Road northbound right turns at the proposed site driveway met the warrant for an exclusive right-turn lane. In summary, the traffic volumes show that a Lowell Road northbound right-turn lane is warranted with 2023 Build weekday PM and Saturday midday traffic volumes as well as with 2033 Build weekday AM peak hour traffic volumes. The auxiliary lane calculation worksheets are provided in the Appendix.

Intersection analyses were conducted with these proposed improvements in place as reflected in Table 8 for the 2033 Build peak hour traffic volumes. The capacity analysis worksheets are provided in the Appendix. As shown, these improvements would result in operations that mitigate the project's traffic impacts at the Lowell Road and Central Street signalized intersection during the weekday AM, weekday PM, and Saturday midday peak hour conditions. In addition, available capacity is shown to be provided on the lane groups (i.e., v/c ratios < 1.00) during the weekday AM and Saturday midday peak hour conditions. Due to the traffic volumes developed for the weekday PM peak hour conditions, an additional Lowell Road northbound through lane is needed independent of the proposed development. This additional travel lane would require widening along Central Street north of the signalized intersection to receive the two northbound through lanes that could then join with the two lane approach to the Library Street signalized intersection. Properties to the north of the Lowell Road signalized intersection, however, are not under the control of the applicant.

Memorandum

Summary of Findings

Existing and future conditions in the study area have been described, analyzed, and evaluated with respect to traffic operations and the impact of the proposed commercial development to be located on the southeast corner of the Lowell Road and Central Street signalized intersection. Common traffic engineering practice suggests that a development may have a noticeable impact if the addition of site trips increases traffic volumes at an intersection by 100 vehicles per hour or more. Based on the findings of this traffic study, the site trips for the proposed development do not trigger this threshold through the study area intersections.

With the location of the subject in relation to the Lowell Road and Central Street signalized intersection, there is an opportunity to widen Lowell Road and Central Street to extend the existing travel lanes approaching the intersection. As part of the proposed development, the applicant is proposing to implement the following measures. These improvements will be coordinated with Town staff.

- › Extend the Lowell Road northbound two-lane approach from Central Street to south of the proposed site driveway.
- › Extend the Central Street westbound two-lane approach from Lowell Road easterly to the proposed site driveway.
- › Optimize the traffic signal timings.

With these improvements constructed, intersection operations are projected to create available capacity within the currently oversaturated lane groups during the weekday AM and Saturday midday peak hours. These improvements are also envisioned to assist Town officials with future improvements along the corridor.

Intersection Summary

- ~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Mitigated Intersection Operational Analyses

Meeting Date: 11/29/23

DIGITAL COPY 2023 Central Gas Site Plan - Attachment D

Figure 2 - 6. Guideline for determining the need for a major-road right-turn bay at a two-way stop-controlled intersection.

2023 Build Weekday AM Peak Hour

Figure 2 - 6. Guideline for determining the need for a major-road right-turn bay at a two-way stop-controlled intersection.**2023 Build Weekday PM Peak Hour**

| INPUT | |
|---|----------------|
| Roadway geometry: | 2-lane roadway |
| Major-road speed, mph: | 35 |
| Major-road volume (one direction), veh/h: | 1335 |
| Right-turn volume, veh/h: | 35 |

| OUTPUT | |
|------------------------------------|-------|
| Variable | Value |
| Limiting right-turn volume, veh/h: | 6 |

Guidance for determining the need for a major-road right-turn bay for a 2-lane roadway:
Add right-turn bay.

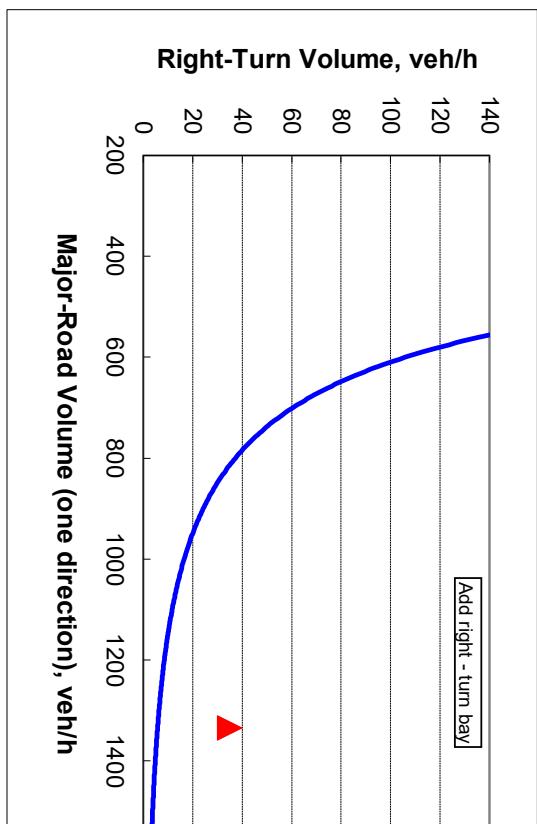

Figure 2 - 6. Guideline for determining the need for a major-road right-turn bay at a two-way stop-controlled intersection.

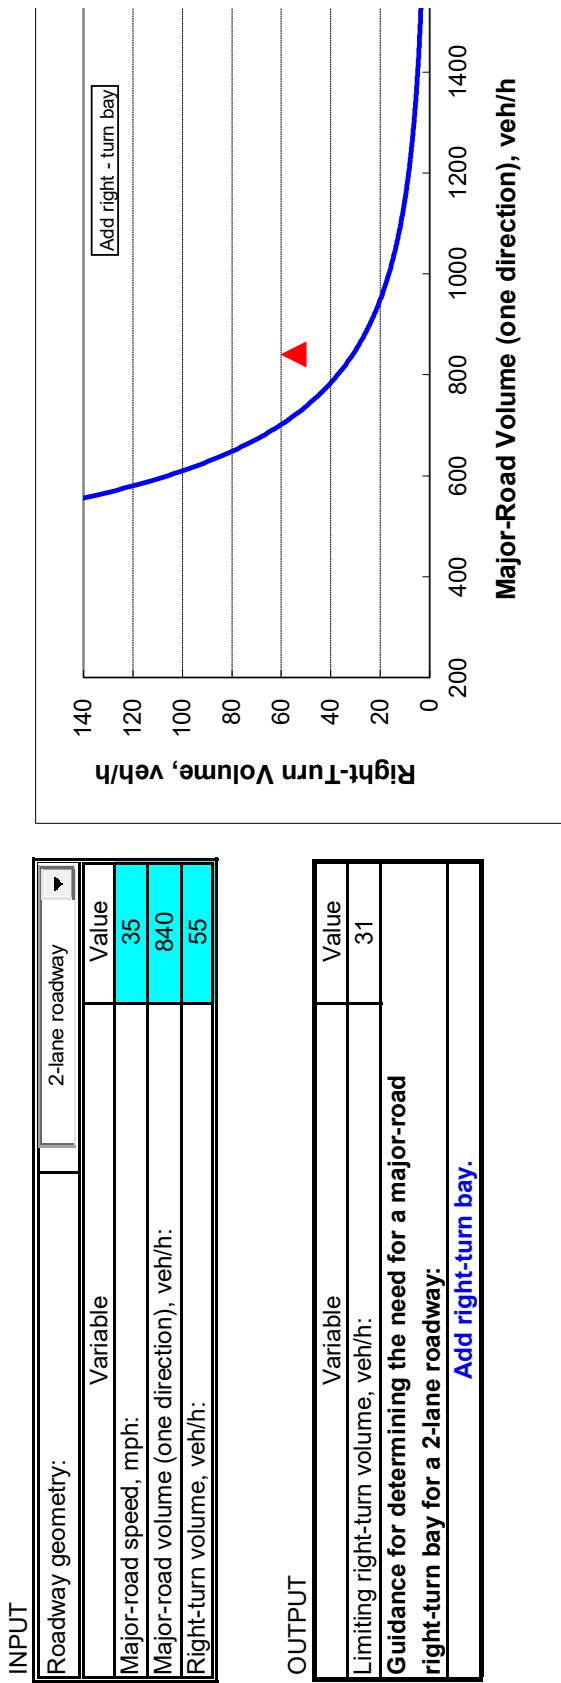

Figure 2 - 6. Guideline for determining the need for a major-road right-turn bay at a two-way stop-controlled intersection.

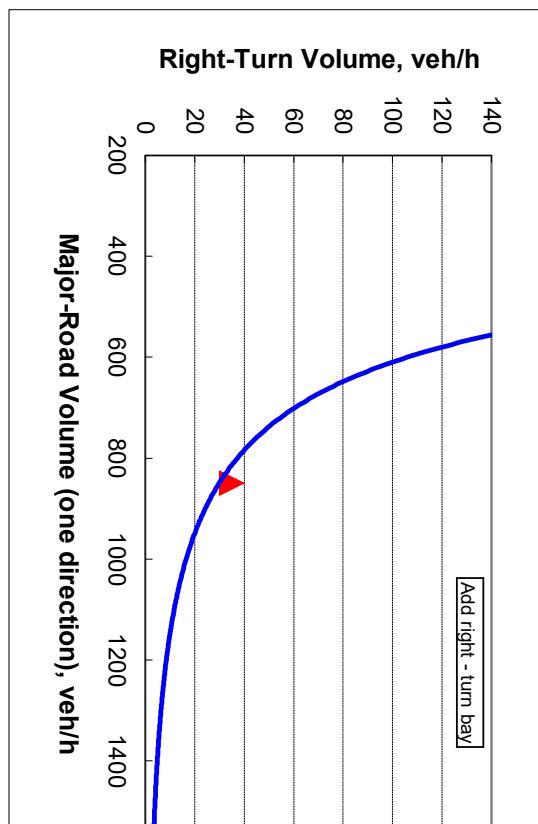

2033 Build Weekday AM Peak Hour

| INPUT | |
|---|----------------|
| Roadway geometry: | 2-lane roadway |
| Major-road speed, mph: | 35 |
| Major-road volume (one direction), veh/h: | 850 |
| Right-turn volume, veh/h: | 35 |

| OUTPUT | |
|------------------------------------|-------|
| Variable | Value |
| Limiting right-turn volume, veh/h: | 30 |

Guidance for determining the need for a major-road right-turn bay for a 2-lane roadway:

Add right-turn bay.

Intersection Summary

- ~ Volume exceeds capacity, queue is theoretically infinite.
 Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.
